# What is Program Synthesis?

Given a **program specification**, **automatically generate** a program that is **mathematically guaranteed** to implement the given specification.

## Why is this useful?

Often times excellent for **filling in unknown constants**, e.g. computing the **mask** when extracting bits from a **bit field**.

```
10010101
00001111
10100101
00000101
```

# Specification

```
r = 0;
done = 0;
repeat i : 4 {
  if ((done == 0) and
      (not
        (x & (1 << i) == 0))) {
    done = 1;
    r = 1 << i;
  }
}
done = 1;
```

A program “sketch”

```
r = (x + ??) & ~(x + ??);
done = 1;
i = 3;
```

An Example: Isolate the rightmost 1 bit

## Output

```
r = x + 0 & ~(x + 15);  
done = 1;  
i = 3;
```

```
r = (x + ??) & ~(x + ??);  
done = 1;  
i = 3;
```

An Example: Isolate the rightmost 1 bit
